

METHOD TO CUSTOM COLORIZE TYPE FACE

ABSTRACT OF THE DISCLOSURE

PostScript® or TrueType® output font can be printed and displayed with varying colors through-out each character or letter so as to appear to be colorized differently. By manipulating the pixels of a polygon of a glyph that comprises a character or letter, different colors, lines or textures can be assigned to each
5 constituent polygon. When the polygons are re-assembled, the resultant glyph can be made to appear to have different color components, textures or other characteristics.
